(Beijing Forestry University Beijing 100083)

**Abstract** In this paper, a new species of *Prosentoria* from Yunnan Province is described. The type specimen is deposited in the Institute of Zoology, Academia Sinica. All measurements in descriptions are in mm.

## Prosentoria bannaensis sp. nov. (figs. $1\sim2$ )

This new species is allied to *P. lobicornis* Brunner, it differs from the latter in: Head without lobes between the eyes; front femur with many teeth densely arrayed.

Length: body (the operculum excluded) 94.0; pronotum 3.0; mesonotum 18.4; metanotum (with median segment) 16.0; median segment 3.0; abdomen 52.8; operculum 19.2; front femur 28.0; intermediate femur 19.0; hind femur 22.0.

Male: unknown.
